# EXPERIMENT 12

## **Application Name:** Loan Application and Pre-screening Management

**## Implementing Security Features and Governance Practices in Zoho Creator**

****Roll Number:** 241401087**
****Platform:** Zoho Creator**

241401087

### 1. Aim

To explore and understand the security features and governance practices available in Zoho Creator, including user permissions, role hierarchy, data-sharing rules, and portal user permissions, while maintaining the confidentiality and security of loan applicant information.

### 2. Software Requirements

- Zoho Creator account
- Web browser and internet connection
- Loan Application and Pre-screening Management application

### 3. Introduction

Zoho Creator provides security and governance features that control access to applications and their data. These features help administrators determine who can view, add, modify, or manage records.

The major security features explored in this experiment are:

1. **User Permissions:** Define the operations users can perform within an application.
2. **Role Hierarchy:** Organizes users into reporting levels and can help control access to records.
3. **Data Sharing:** Specifies how records are shared between users or roles.
4. **Portal User Permissions:** Controls the access available to external users who interact with an application through a portal.

These features are particularly important in a loan management application because applicant contact details, financial information, and other personal data must be protected against unauthorized access.

### 4. Procedure

**Step 1: Open the application**

1. Log in to Zoho Creator.
2. Open the Loan Application and Pre-screening Management application.
3. Enter the application’s Edit mode.
4. Navigate to the Settings section.

**Step 2: Inspect User Permissions**

1. Open **User Permissions**.
2. Select the Permissions tab.
3. Observe the predefined permission sets.
4. Identify the available option to add a permission set.
5. Record the existing permissions without modifying them.

**Step 3: Inspect Role Hierarchy**

1. Open the Roles tab under User Permissions.
2. Observe the existing organizational hierarchy.
3. Identify the roles currently configured.
4. Inspect the Manage Role Hierarchy option.
5. Record the hierarchy without adding or changing roles.

**Step 4: Inspect Data Sharing**

1. Open the Data Sharing tab.
2. Observe the list of configured sharing rules.
3. Check whether any existing rules are present.
4. Identify the Add Rule option.
5. Record the observations without creating a new rule.

**Step 5: Inspect Portal User Permissions**

1. Open Portal User Permissions.
2. Read the available description and permission information.
3. Observe the configured portal permission profile.
4. Record the displayed access description without changing any settings.

**Step 6: Verify the configuration**

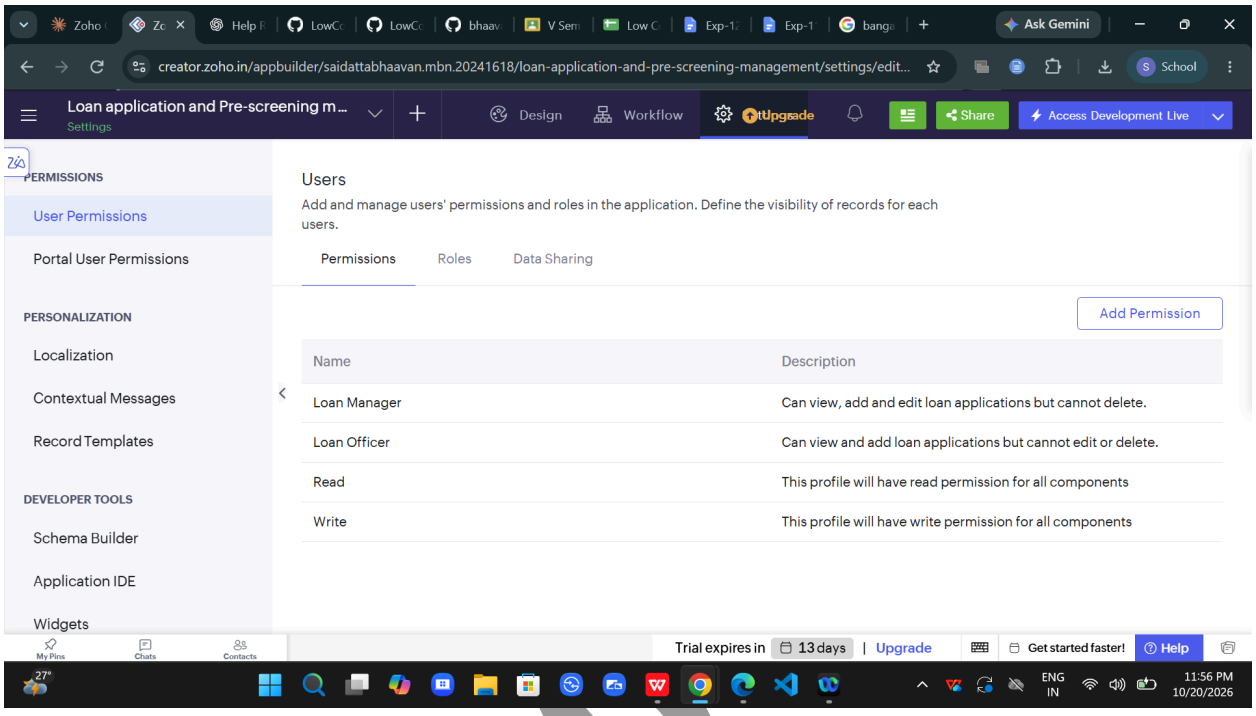

Review the four security sections and confirm that all observations have been recorded. Leave the application’s configuration unchanged.

## ### 5. Observations

****A. User Permissions****

2414010087

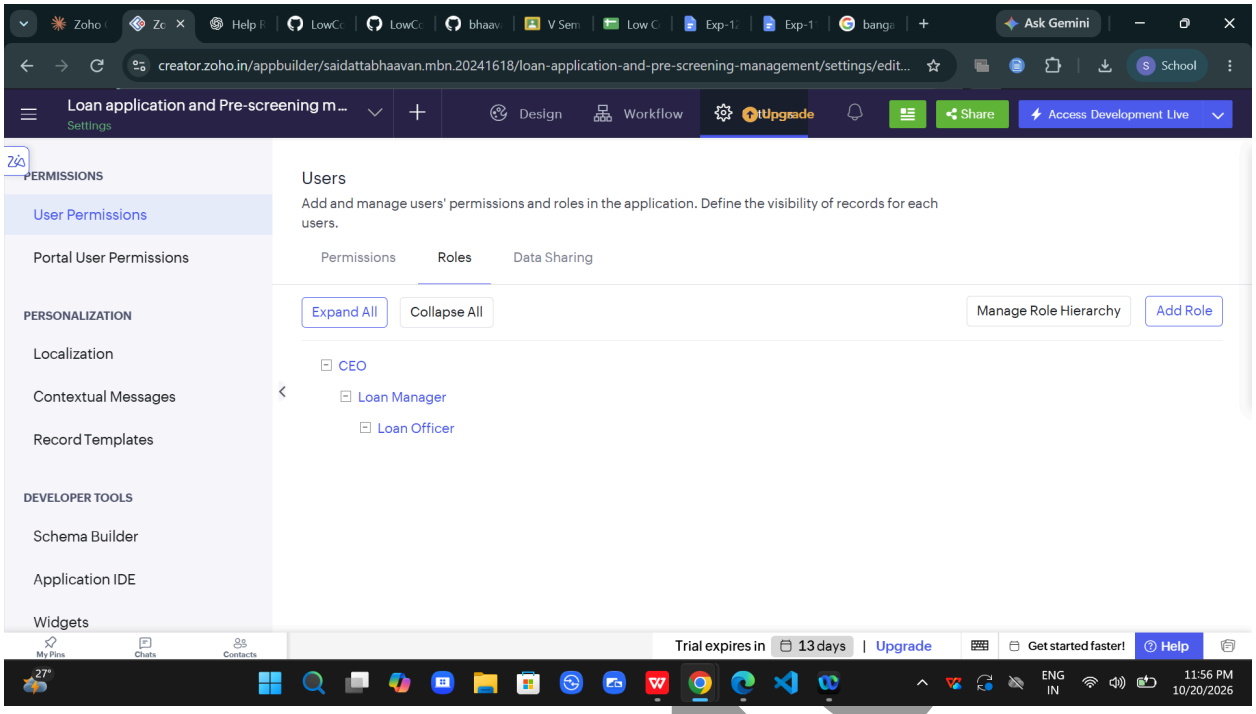

- The Permissions tab displayed the predefined **Read** and **Write** permission sets.
- The **Add Permission** option was visible.
- These settings provide a way to define application access according to user responsibilities.

## **B. Role Hierarchy**

- The Roles tab displayed **CEO** as the existing role in the hierarchy.
- The **Manage Role Hierarchy** option was available.
- No additional roles were created, and the existing hierarchy was left unchanged.

24140

**C. Data Sharing**

- No data-sharing rules were listed.
- The **Add Rule** option was visible.
- No sharing rules were created or modified during the experiment.

**D. Portal User Permissions**

- The page displayed the heading **Portal User Permissions**.
- The description stated that portal users' permissions for the application can be added and managed.
- The configured permission profile was named **Customer**.
- Its displayed description was **"Profile has add and view permission."**
- No portal permissions were modified.

### 6. Result

The security and governance features of Zoho Creator were successfully explored in the Loan Application and Pre-screening Management application. User Permissions, Role Hierarchy, Data Sharing, and Portal User Permissions were inspected, and their existing configurations were documented without making any changes.

### 7. Conclusion

24140

This experiment demonstrated how Zoho Creator supports application security through permission management, organizational role hierarchies, record-sharing controls, and portal user permissions.

For a loan application system, these features help protect confidential applicant information and ensure that access is granted according to users' responsibilities. Applying the principle of least privilege, sharing records selectively, and reviewing access permissions regularly are important governance practices.

### ### 8. Precautions

1. Do not grant unnecessary permissions to users.
2. Protect applicant financial and personal information.
3. Review existing roles and permissions before making changes.
4. Configure data-sharing rules only when required and authorized.
5. Keep external portal access separate from internal administrative access.
6. Avoid modifying production settings during an inspection-only experiment.
7. Use dummy applicant data when capturing screenshots for the practical record.
